- Use the standard cable length for the current sensor and check by placing the measurement conductor at the center of the sensor.
- For current sensors that are compatible with the measuring instrument, refer to the respective instruction manuals.
- For measuring instruments and current sensors that support the memory function, the phase correction value is set automatically.
- Please contact us separately if you are using the CT9557.
- If the VT1005 (high-voltage differential probe) is used, the representative phase difference value used for setting will change.

Refer to the separate document, "Typical values of current sensor phase characteristics (when using the VT1005)."
