Measure the Voltage Characteristics of Electric Double-layer Capacitors for Hybrid Electric Vehicles (HEVs)

Measure and record the temporal characteristics of the voltage between terminals in electrical characteristics tests of individual electric double-layer capacitance cells for HEVs.

Highlights

・Use the LR8431-20 MEMORY HiLOGGER to perform continuous and temporal measurement of the voltage between capacitor terminals in the capacity, internal resistance and maximum output density test and the charge/discharge efficiency test. (It can perform measurement and record at a high speed of up to 10 ms and has a high voltage resolution of 0.5 mV in the 10V f.s. range)

・The LR8431-20 can also be used to perform continuous and temporal measurement of voltage between capacitor terminals over several days in the voltage holding characteristics test. (When the measurement data is saved in real-time to a 1 GB CF card, the data can be recorded for approximately 32 days at a recording interval of 100ms on 10-channels)

Products used

・MEMORY HiLOGGER LR8431-20

・PC CARD (1GB) 9729

Options for current measurement

・AC/DC CURRENT SENSOR CT6862(50A)

・SENSOR UNIT 9555-10

・Information valid as of November 2014.

・Specifications are subject to change and revision without notice.
